

GlowUp Store

Online Cosmetics Shopping System

Project Documentation Report
Web-Based E-Commerce Application

Technology: PHP · MySQL · HTML · CSS

1. Project Overview

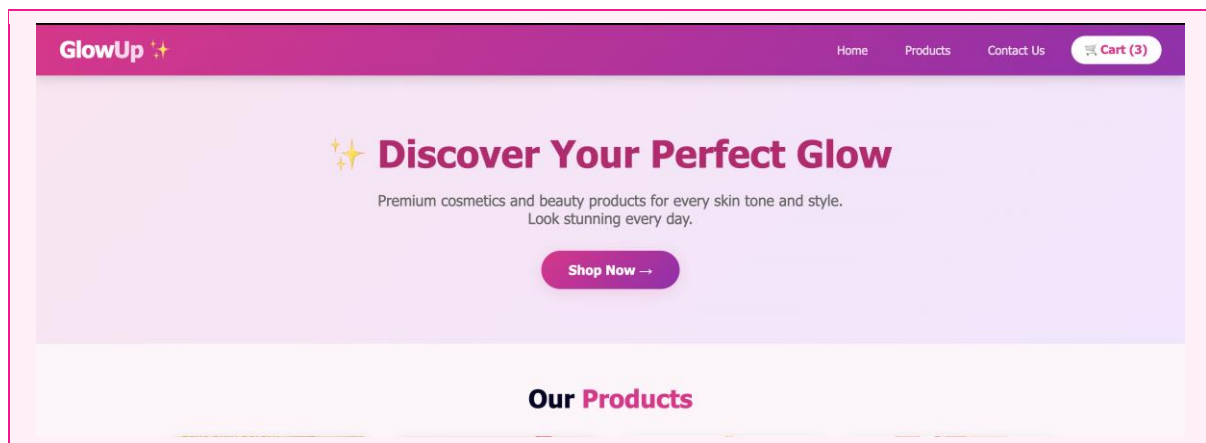

GlowUp Store is a web-based online shopping system designed specifically for beauty and cosmetics products. The platform provides a seamless and user-friendly experience for customers browsing, selecting, and purchasing makeup products online.

The system is built using PHP and MySQL, following a straightforward architecture that is easy to deploy on any standard web server such as XAMPP or WAMP. It is designed for the Saudi Arabian market with SAR pricing and Arabic-friendly layouts.

1.1 Project Objectives

- Provide an attractive and intuitive storefront for cosmetics shoppers.
- Allow customers to browse products by category, view details, and add to cart.
- Implement a complete checkout and order placement workflow.
- Give administrators full control to manage products, inventory, and orders.
- Store all data securely using a MySQL relational database.

2. Technology Stack

The following technologies were used to build GlowUp Store:

Feature	Description
PHP	Server-side scripting language used for all backend logic, database queries, and session management.
MySQL	Relational database management system storing products, orders, admin accounts, and order items.
HTML5 / CSS3	Frontend markup and styling. Custom CSS with Google Fonts for a modern pink/purple cosmetics aesthetic.

JavaScript	Used for image preview on admin upload forms and client-side interaction enhancements.
XAMPP / WAMP	Local development server environment. Apache web server with PHP and MySQL pre-configured.

3. Database Design

The database (glowup_store) contains four tables designed to handle all store data efficiently. The schema follows standard relational design with primary and foreign keys.

3.1 Table: product

Stores all product information including the image filename (not binary data).

Feature	Description
id	INT — Primary Key, Auto Increment
name	VARCHAR(255) — Product name
category	VARCHAR(100) — Product category (e.g., Foundation, Lipstick)
price	DECIMAL(10,2) — Product price
quantity	INT — Stock quantity
description	TEXT — Full product description
image	VARCHAR(255) — Image filename only (stored in /uploads/)
created_at	TIMESTAMP — Record creation date

3.2 Table: admin

Feature	Description
id	INT — Primary Key, Auto Increment
username	VARCHAR(100) — Unique admin username
password	VARCHAR(255) — Bcrypt hashed password
email	VARCHAR(255) — Admin email address
created_at	TIMESTAMP — Account creation date

3.3 Table: orders

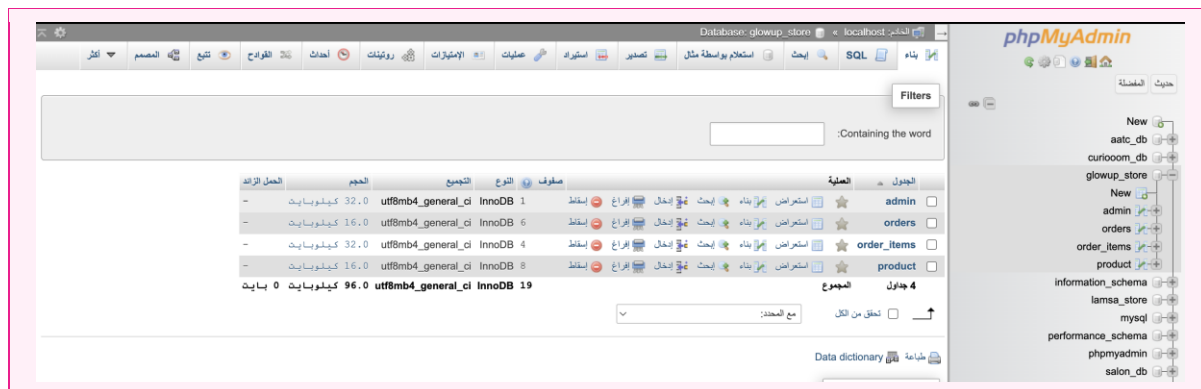

Feature	Description
---------	-------------

id	INT — Primary Key, Auto Increment
customer_name	VARCHAR(255) — Customer full name
customer_email	VARCHAR(255) — Customer email
customer_phone	VARCHAR(50) — Customer phone number
total_amount	DECIMAL(10,2) — Total order value
status	VARCHAR(50) — Order status (default: pending)
created_at	TIMESTAMP — Order placement date

3.4 Table: order_items

Feature	Description
id	INT — Primary Key, Auto Increment
order_id	INT — Foreign Key referencing orders(id)
product_id	INT — Reference to product
product_name	VARCHAR(255) — Snapshot of product name at time of order
quantity	INT — Number of units ordered
price	DECIMAL(10,2) — Unit price at time of order

4. System Pages & Features

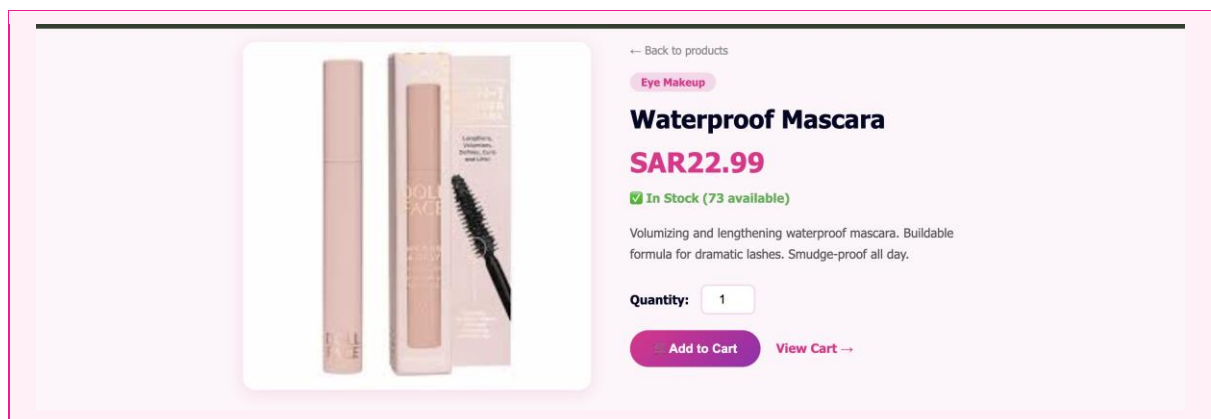

4.1 Homepage — index.php

The homepage displays all available products in a responsive grid layout. Each product card shows the product image, category badge, name, price, and an 'Add to Cart' button. A sticky navigation bar provides access to all sections.

4.2 Product Detail — product.php

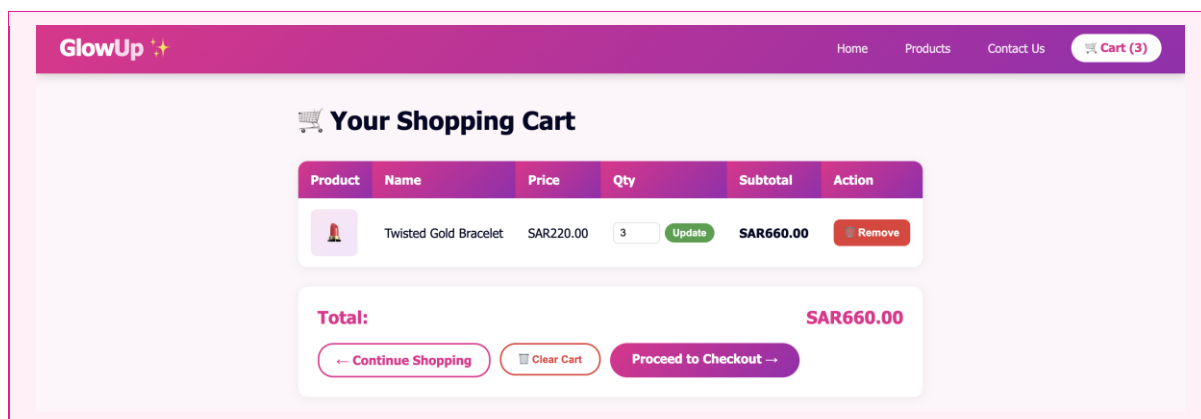

Clicking any product opens a dedicated detail page showing the full product image, category, name, price, stock availability, description, quantity selector, and an Add to Cart button. Users can adjust quantity before adding.

4.3 Shopping Cart — cart.php

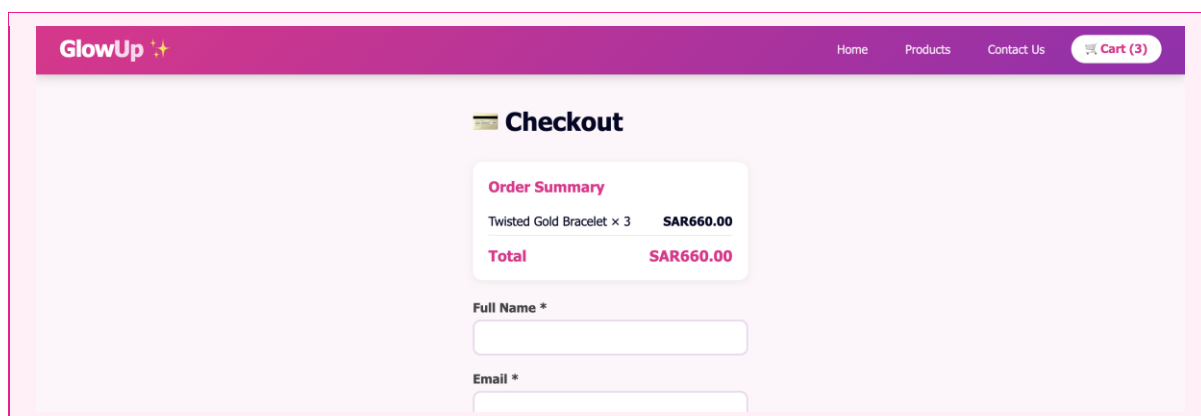

The cart page lists all items added by the user. For each item the customer can: update quantity, remove individual items, or clear the entire cart. A running total is displayed and the customer can proceed to checkout.

Feature	Description
Update Quantity	Change the quantity of any cart item and click Update.
Remove Item	Delete a single product from the cart.
Clear Cart	Remove all items from the cart at once.
Checkout	Proceed to the order placement form.

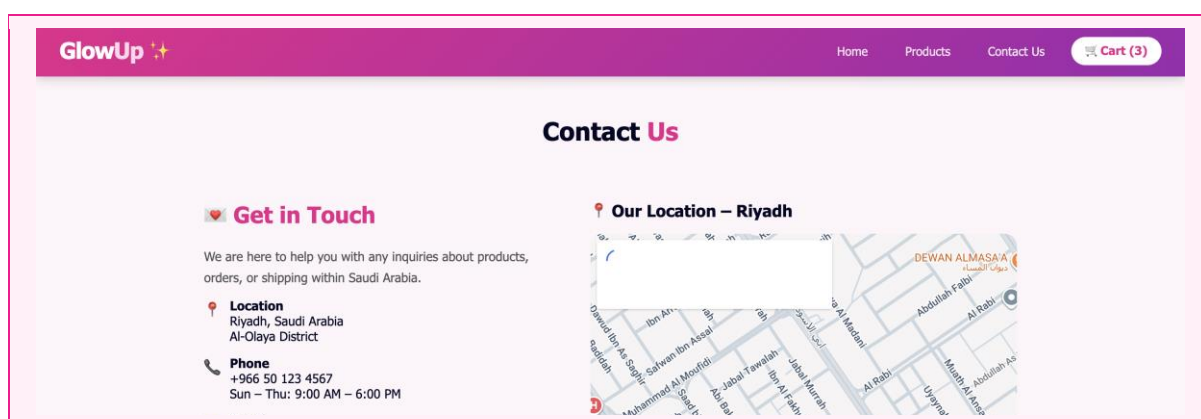

4.4 Checkout — checkout.php

The checkout page shows an order summary and collects customer information: full name, email, phone number, and shipping address. On submission the order is saved to the database and stock quantities are reduced automatically.

4.5 Contact Us — contact.php

The contact page includes store location details, phone numbers, email addresses, business hours, a quick message form, and a Google Maps embed showing the store location.

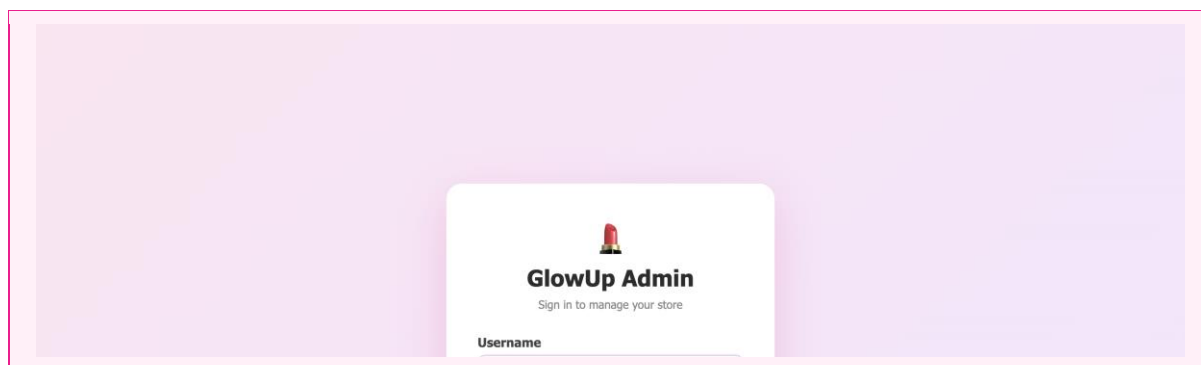

5. Admin Panel

The admin panel is a password-protected area accessible at `/admin/login.php`. It provides full control over the store including product management, order tracking, and inventory oversight.

5.1 Admin Login — `admin/login.php`

The admin login page uses a secure form with bcrypt password verification. Default credentials are `admin / admin123` (should be changed in production).

5.2 Dashboard — `admin/dashboard.php`

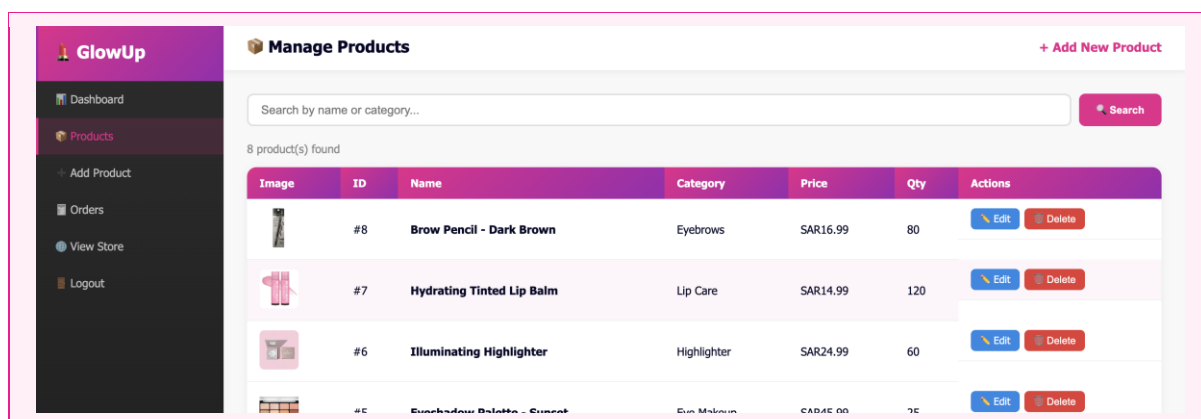

The dashboard shows four key metrics at a glance: Total Products, Total Orders, Total Revenue, and Low Stock Items. Below the stats, a table of recent orders is displayed.

Order #	Customer	Email	Total	Status	Date
#6	test	test@test.test	SAR45.98	pending	Apr 15, 2026
#5	code code code	p.p.code2@gmail.com	SAR18.99	pending	Apr 15, 2026
#4	code code code	p.p.code2@gmail.com	SAR0.02	pending	Apr 15, 2026
#3	code code code	p.p.code2@gmail.com	SAR0.02	pending	Apr 15, 2026
#2	code code code	p.p.code2@gmail.com	SAR0.02	pending	Apr 15, 2026

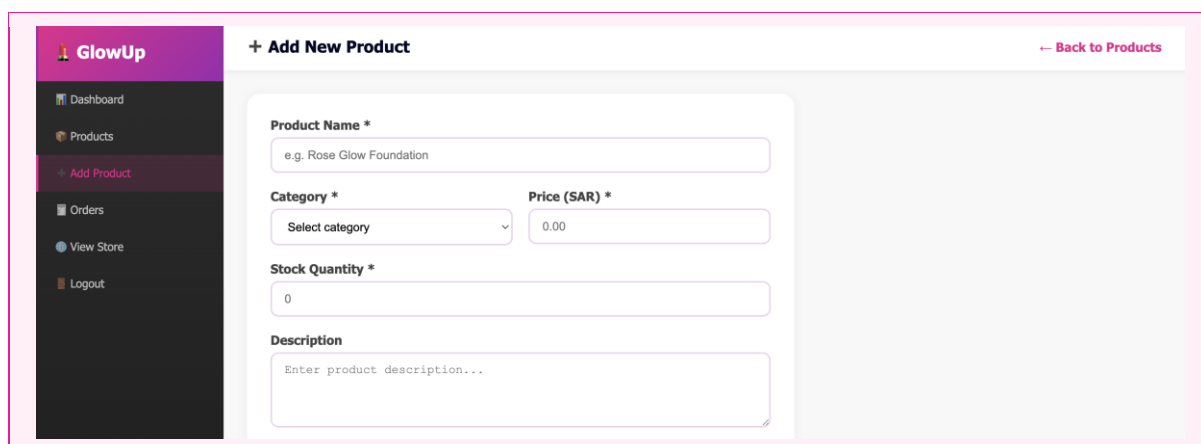

5.3 Product Management — `admin/products.php`

The products page lists all products in a searchable table. Administrators can search by name or category, edit any product, or delete it. Each row shows the product thumbnail, ID, name, category, price, and stock.

5.4 Add Product — admin/add_product.php

The add product form collects: product name, category (dropdown), price, stock quantity, description, and an image upload. A live image preview is shown before submission. The image is stored as a filename in the database.

5.5 Edit Product — admin/edit_product.php

The edit page pre-fills all fields with the existing product data. Administrators can update any field and optionally replace the product image. The current image is displayed so the admin can decide whether to keep or replace it.

GlowUp Edit Product #8 [← Back to Products](#)

Product Name *
Brow Pencil - Dark Brown

Category * Eyebrows **Price (SAR) *** 16.99

Stock Quantity *
80

Description
Ultra-fine brow pencil for precise, hair-like strokes. Long-lasting formula with a spoolie brush on the other end.

5.6 Orders — admin/orders.php

The orders page shows all customer orders in a table with order number, customer details, total amount, status, date, and the items ordered. This allows the admin to track all purchases made through the store.

GlowUp Customer Orders 1 total orders

Order #	Customer	Email	Phone	Total	Status	Date	Items
#6	test	test@test.test	555555555	SAR45.98	Pending	Apr 15, 2026 5:02am	Waterproof Mascara x2

6. File Structure

The project follows a clean, flat file structure that is easy to navigate and deploy:

Feature	Description
index.php	Homepage — product listing with category filter
product.php	Product detail page with Add to Cart
cart.php	Shopping cart — modify, delete, checkout
checkout.php	Order form and order confirmation
contact.php	Contact info, message form, Google Map
config.php	Database connection and session initialization
database.sql	SQL file to create and seed the database

css/style.css	All frontend styles — pink/purple theme
uploads/	Folder for uploaded product images
admin/login.php	Admin authentication page
admin/dashboard.php	Admin overview with stats and recent orders
admin/products.php	Admin product list with search
admin/add_product.php	Add new product with image upload
admin/edit_product.php	Edit existing product with image upload
admin/orders.php	View all customer orders
admin/logout.php	Destroy session and redirect to login
admin/auth_guard.php	Included in every admin page to enforce login

7. Installation & Setup

Step 1 — Install XAMPP

- Download XAMPP from apachefriends.org
- Install and start Apache and MySQL from the XAMPP Control Panel

Step 2 — Copy Project Files

- Extract the zip file
- Copy the glowup/ folder to C:/xampp/htdocs/

Step 3 — Create the Database

- Open your browser and go to <http://localhost/phpmyadmin>
- Click 'New' and create a database named glowup_store
- Select the database, click 'Import', and upload database.sql
- Click 'Go' — all tables and sample data will be created

Step 4 — Run the Application

- Customer Store: <http://localhost/glowup/>
- Admin Panel: <http://localhost/glowup/admin/login.php>
- Admin Login: username = admin / password = admin123

Step 5 — Add Product Images

Upload product images to the /glowup/uploads/ folder. When adding or editing a product in the admin panel, the uploaded image will be stored in this folder automatically.

8. Product Categories

GlowUp Store comes pre-loaded with 8 sample products across 6 makeup categories. New categories can be added freely through the admin panel.

Feature	Description
Foundation	Full-coverage and tinted foundations for all skin tones
Lipstick	Matte, glossy, and satin lip colors
Lip Care	Tinted balms, lip masks, and treatments
Eye Makeup	Mascara, eyeliner, eyeshadow palettes
Contouring	Contour palettes, bronzers, and blush
Highlighter	Illuminating powders and liquid highlighters
Eyebrows	Brow pencils, gels, and powders

9. System Logical Flow

9.1 Customer Flow

1. Customer visits the Homepage (index.php) — browses all products
2. Clicks a product card — taken to Product Detail page (product.php)
3. Selects quantity and clicks 'Add to Cart'
4. Visits Cart (cart.php) — can modify quantity, delete items, or clear all
5. Clicks 'Proceed to Checkout' — fills in personal details
6. Clicks 'Place Order' — order saved to database, cart is cleared

9.2 Admin Flow

1. Admin visits /admin/login.php and enters credentials
2. Redirected to Dashboard — sees stats and recent orders
3. Clicks 'Products' to see, search, edit or delete products
4. Clicks '+ Add Product' to add a new item with image upload
5. Clicks 'Orders' to review all customer purchases
6. Clicks 'Logout' to end the session securely
